Patent No. 5569745
GENERAL INFORMATION:
APPLICAMY: Goodbody, Anne
APPLICAMY: Pollak, Alfred
TITLE OF INVENTION: PEPTIDE-CHELATOR CONJUGATES
NUMBER OF SEQUENCES:
ADDRESSE: Foley & Lardner
STREET: Sulte 500, 3000 K Street, N.W.
CITY: Washington, D.C.
COUNTRY: USA
ZIF: 20007-5109
COMPUTER: READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: Plum PC Compatible
OPERATION SYSTEM: PC-0005/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURSIFICATION NUMBER: US/08/202,178
FILING DATE: 25-FEB-1994
CLILING DATE: 25-FEB-1994
TILING DATE: 25-FEB-1994
TILING DATE: 25-FEB-1994
TELECOMMUNICATION INFORMATION:
REFERENCE/DOCKET NUMBER: 16/777/258/ALLE
TELEPHONE: (202) 672-5300
TELEBERAX: (202) 672-5399

Sequence 21156, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J Rubenfield et al.
APPLICANT: Marc J Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPRENCE: 107196, 136
CURRENT APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR FILING DATE: 1998-07-27
NUMBER OF SEQ ID NOS: 33142
LENGTH: 136

Sequence 8820, Application US/09489039A

Patent No. 6610836

GENERAL INFORMATION:
APPLICANT: Gary Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PNEUMONNAE FOR DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION: WUMBER: US/09/489,039A

CURRENT APPLICATION NUMBER: US 60/117,747

PRIOR APPLICATION NUMBER: US 60/117,747

PRIOR ELING DATE: 1999-01-29

NUMBER OF SEQ ID NOS: 14342

Leukocyte-targetting peptide used in diagnostic imaging.
AAW11052 standard; peptide; 5 AA.
                               03-JUN-1997 (first entry)
                AAW11052;
       SKSKEKEKSKK
```

Leukocyte, target, direct, chelator, radionuclide, radiolabel, isotope, diagnostic imaging.

Synthetic.

WO9603427-A1

```
peptide can be coupled to a metal radionuclide chelator (structural peptide can be coupled to a metal radionuclide chelator (structural computation in the specification), labelled with a diagnostically useful metal isotope, to form a peptide derived radionuclide chelator. When the chelator is coupled to a targeting molecule and labelled with a diagnostically useful metal, it can be used to detect pathological conditions by diagnostic imaging. For example, AMM1052 targets the conditions by diagnostic imaging. For example, AMM1052 targets the conditions by diagnostic imaging. For example, AMM1052 targets the conditions by diagnostic imaging. For example, AMM1052 targets the conditions by diagnostic imaging, 19040, 203Pb, 212Pb and 212Bi. The coupling of a targeting agent and radionuclide using a chelating agent is an alternative to the direct labelling of targeting agents in which radionuclides are typically bound at the more numerous low- affinity sites, forming unstable complexes. The new conjugates give better sites, forming unstable complexes. The new conjugates give better schemating agents in rad inflammation studies than known imaging agents da-67, 99m7c-1gd, 1111 mW6c and 99m7c-Manocoll. They image more replainty than the known agents and show superior biodistribution
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Target, delivery, radionuclide chelator; diagnosis; therapy, detection; atherosclerosis; thrombosis; Alzheimer's disease.

The invention relates to a composition for use in targeting endothelial cells, tumour cells, or other cells which express NP-1. The activity of compositions of the invention may be described as cytostatic. Compounds of the invention are useful in pharmaceutical compositions for inhibiting angiogenesis, for imaging and targeting an angiogenic site, endothelial cells, tumour cells or other cells that express NP-1 in a human or animal. They may also be used as ultrasound contrast agents, for staging a tumour in a human or animal. For screening for the ability of an agent to target endothelial cells, tumour cells or other cells that express NP-
present sequence represents the tuftsin receptor antagonist peptide given in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "residue optionally modified by one of the following; Thr(0b21), DPPE-Glutarcyl-Di(aminodioxaoctanoyl), aminodioxaoctanoyl-Thr(OBz1), di(aminodioxaoctanoyl).                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes polypeptide compounds of formula (1), capable of direct transformation into a radiopharmaceutical: Ch.Ln-(X1-X2-X3-X4-X5)d (1), where X1-X5 = amino a radiopharmaceutical: Ch.Ln-(X1-X2 metal bonding unit; and d is selected from 1, 2 and 3. The radiopharmaceuticals are useful for the diagnosis of infection, inflammation and cancer. The radiopharmaceuticals bind in vivo to the tuffsin receptor on the surface of white cells which accumulate at the strength of inflammation and cancer by imaging using a planar or ring gamma cancer. The radiopharmaceuticals by imaging a planar or ring gamma camera. The radiopharmaceuticals can also be used in treating cancer. The
                                                                                                                                                                 AAW31110-W31147 are peptides used for targeting a new hydrazino-type compound to various sites of disease, e.g. atherosclearcit plaque, sites of infection, platelets, thrombus or amyloid plaque. The new compound is a radionuclide chelator and is used to radiolabel the targeting peptides for the detection and diagnostic imaging of sites of disease, e.g. amyloid plaques in Alzheimer's disease. (Updated on 25-MAR-2003 to correct PF field.)
